Summary of Errata and Clarifications to the HDCP on HDMI Specification Rev 2.2

Page 8, insert the following definition under Section 1.2

> **Permitted Type 1 Audio Portion**. *Permitted Type 1 Audio Portion* consists of the audio portion of Audiovisual Type 1 Content Stream which is sampled at no more than 24 bits, with a sampling frequency of no more than 192 kHz and no more than 8 channels. Such audio portions may be transmitted by the HDCP Repeater to all HDCP Devices. The HDCP Repeater must support the transmission of Permitted Type 1 Audio Portions to HDCP-protected Interface Ports connected to HDCP Devices compliant with HDCP 2.2 or higher, if such ports are available at the HDCP Repeater.

Replace all references to HDCP2_0_REPEATER_DOWNSTREAM with HDCP2_LEGACY_DEVICE_DOWNSTREAM.

Page 22, replace first sentence under Section 2.5.1.1 with the following

> When an HDCP Receiver (including HDCP Repeater) is newly connected to the HDCP Repeater or disconnected from the HDCP Repeater, and the HDCP Repeater has already completed the authentication protocol with the upstream HDCP Transmitter, the HDCP Repeater must make the RepeaterAuth_Send_ReceiverID_List message available for the upstream HDCP Transmitter to read, assert the READY status bit and set the Message_Size register to the size of the RepeaterAuth_Send_ReceiverID_List message.

Page 23, replace third sentence in 2nd paragraph under Section 2.5.2 with the following

> Type 0 Content Stream (see Section 4.2.12) and Permitted Type 1 Audio Portion may be transmitted by the HDCP Repeater to all HDCP Devices.

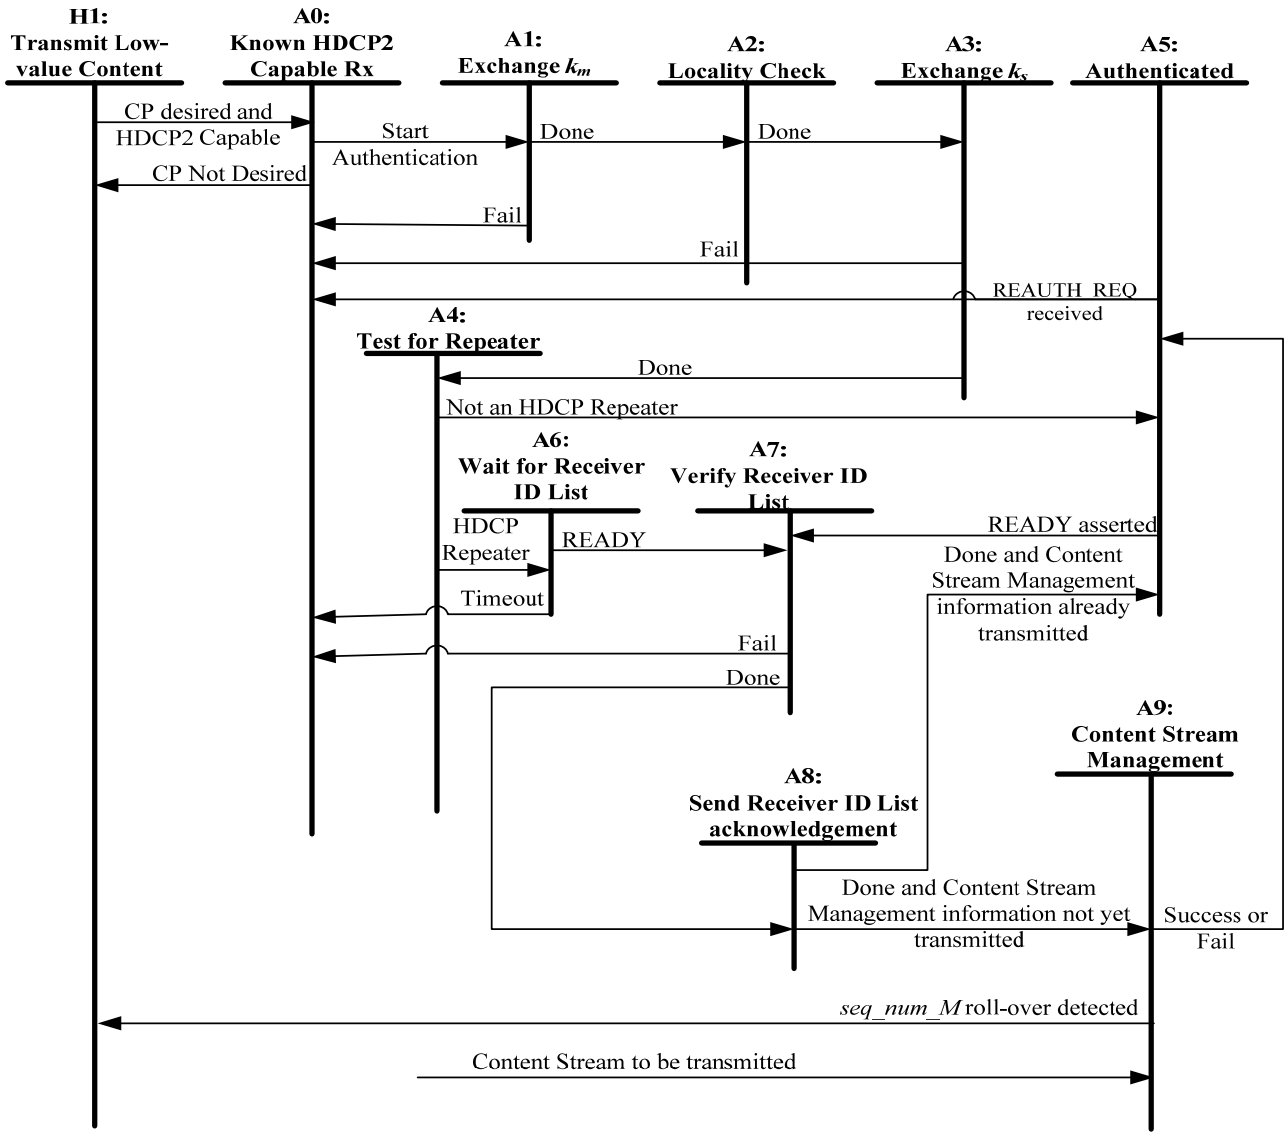
Page 23, replace last sentence in 2nd paragraph under Section 2.5.2 with the following

> Type 1 Content Stream (see Section 4.2.12), except Permitted Type 1 Audio Portion, must not be transmitted by the HDCP Repeater through its HDCP-protected Interface Ports connected to HDCP 1.x-compliant Devices, HDCP 2.0-compliant Devices and HDCP 2.1-compliant Devices.

Page 24, replace the 6th sentence in the 2nd paragraph under Section 2.6 with the following

> The HDCP Receiver must either assert the REAUTH_REQ bit of the RxStatus register or de-assert HDCP_HPD to the upstream transmitter once it determines loss of synchronization.

Page 27, replace Figure 2.12 in Section 2.8 with the following

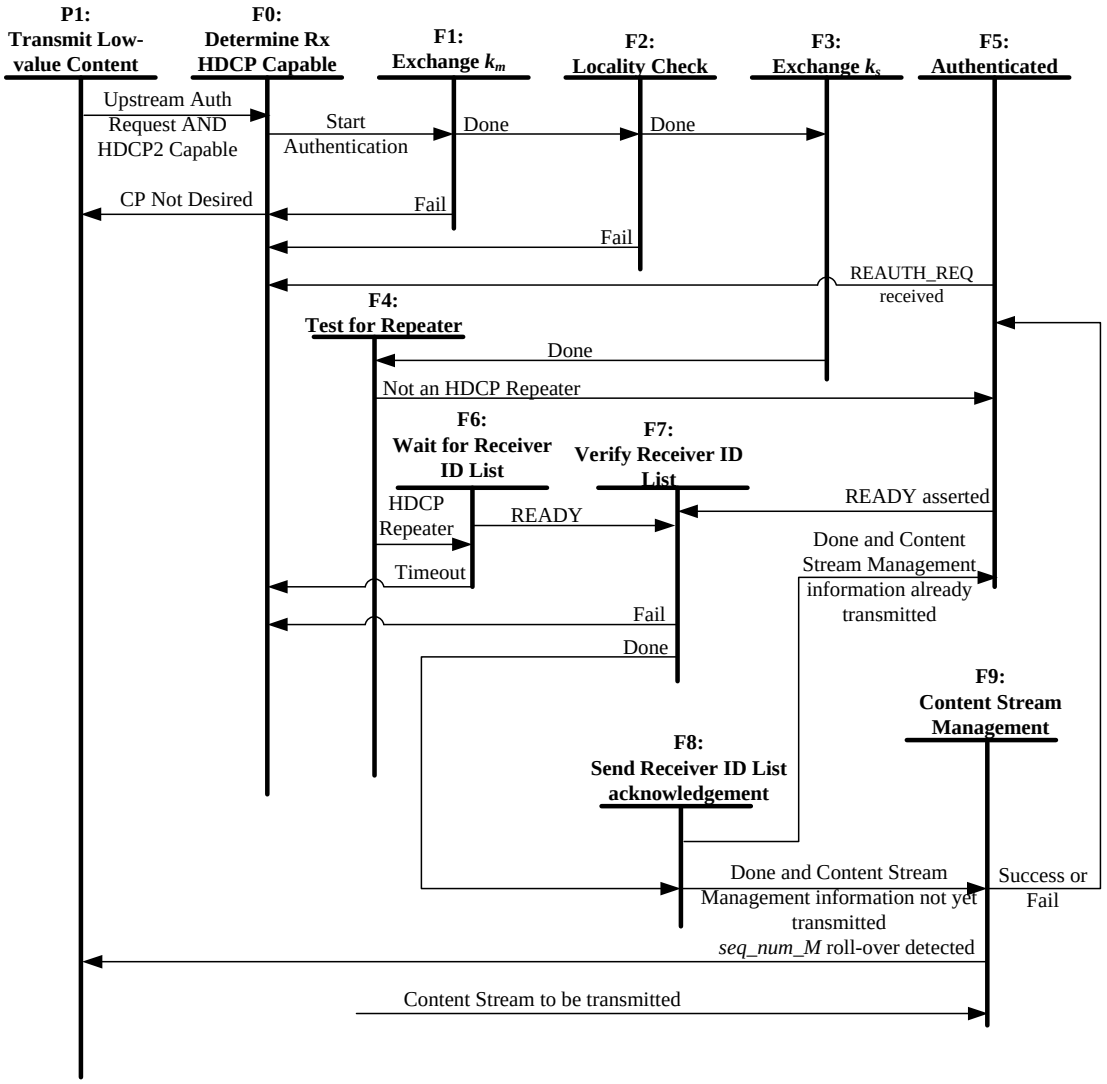


Page 30, insert the following state transition under Section 2.8

Transition A9:H1. This transition occurs if *seq_num_M* rolls over. *seq_num_M* must never be reused during an HDCP Session for the computation of M' (or M). If seq_num_M rolls over, the HDCP Transmitter must disable HDCP Encryption if encryption is enabled, restart authentication by the transmission of a new AKE_Init message.

Note: The addition of *seq_num_M* roll-over is not intended to support any mid-Content Stream Type value change.

Page 35, replace Figure 2.15 in Section 2.10.2 with the following

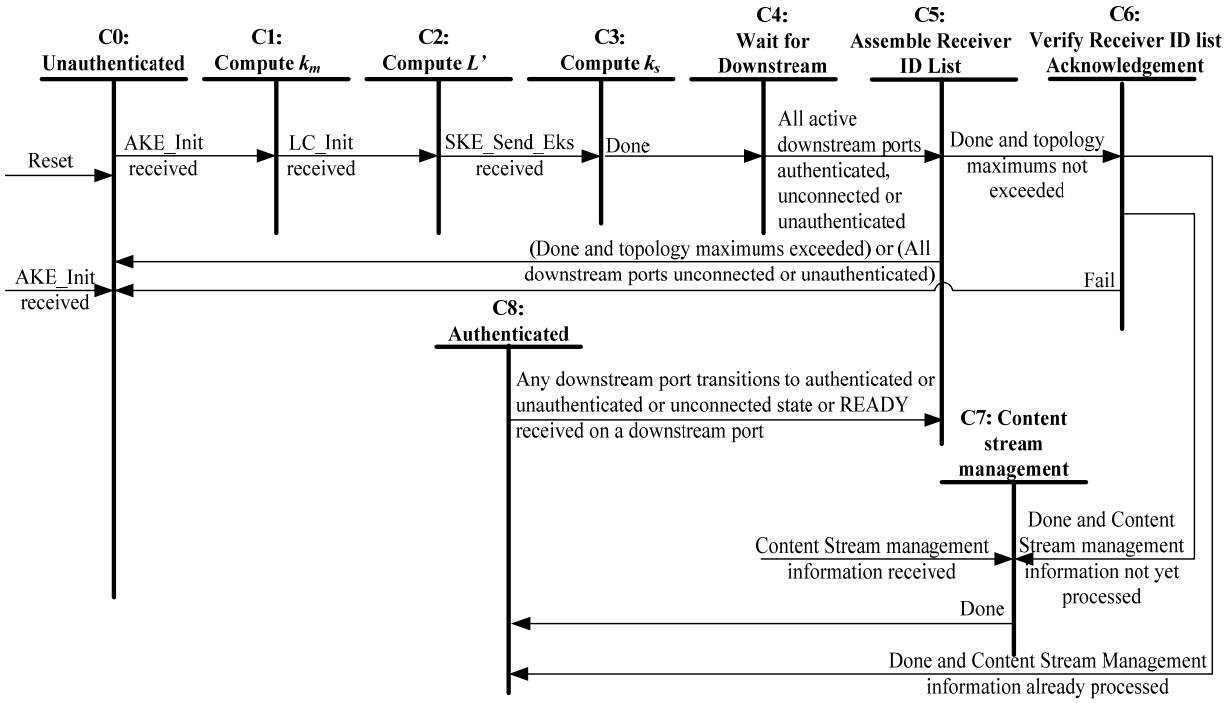


Page 38, insert the following state transition under Section 2.10.2

Transition F9:P1. This transition occurs if *seq_num_M* rolls over. *seq_num_M* must never be reused during an HDCP Session for the computation of M′ (or M). If *seq_num_M* rolls over, the downstream side must disable HDCP Encryption if encryption is enabled, restart authentication by the transmission of a new AKE_Init message.

Note: The addition of *seq_num_M* roll-over is not intended to support any mid-Content Stream Type value change.

Page 39, replace Figure 2.16 in Section 2.10.3 with the following



Page 39, replace 2nd sentence under State C0: Unauthenticated with the following

If a transition in to this state occurred from State C6 or from State C5, when State C5 is implemented in parallel with State C8, the upstream side must either set the REAUTH_REQ status bit in the *RxStatus* register or de-assert HDCP_HPD to the upstream transmitter.

Page 40, replace 11th paragraph with the following

If any downstream port connected to an HDCP Repeater detects the HDCP2_0_REPEATER_DOWNSTREAM or HDCP1_DEVICE_DOWNSTREAM bits read from the repeater to be set to one, the upstream side sets the corresponding bits to one in the *RxInfo* register which is read by the upstream HDCP Transmitter as part of the RepeaterAuth_Send_ReceiverID_List message.

Page 41, add the following paragraph under Transition C8:C5

This transition also occurs when a downstream port that was previously in an authenticated state transitions in to an unauthenticated or unconnected state. For example, the transition may occur when an active, authenticated HDCP Receiver attached to the downstream port is disconnected.

Page 46, replace the last sentence in the 1st paragraph under Section 2.14 with the following

The multi-byte value at offset address 0x70 (*RxStatus*) must be stored in little-endian format. Multi-byte values that are passed through the 1-byte Read_Message (at offset address 0x80) and Write_Message (at offset address 0x60) addresses, as part of the authentication protocol messages

(Section 4), must be transferred in big-endian format. For example, the values r_{tx} and *TxCaps* sent as part of the AKE_Init message, the values $cert_{rx}$, r_{rx} and *RxCaps* sent as part of the AKE_Send_Cert message, the value $E_{kpub}\_k_m$ sent as part of the AKE_No_Stored_km message are all sent in big-endian order.

Page 52, replace the first sentence in 3rd paragraph under Section 3.3 with the following

The CTLx signals described in Table 3.3 are only valid within a 16-clock window of opportunity starting at 512 TMDS character clocks following the active edge of VSYNC.

Page 53, replace the first sentence in the 4th paragraph with the following

It is required that no Data Island or Video Data, nor any Guard Band, be transmitted during a keep-out period that starts 508 TMDS character clocks past the active edge of VSYNC and ends 650 TMDS character clocks past the active edge of VSYNC.

Page 53, replace the first and second sentence in the 7th paragraph with the following

Video Data Periods begin with a two-character Leading Guard Band. The state transition variable videoData is defined to go TRUE on the TMDS character clock coinciding with the first active pixel (or portion of the pixel bits when the pixel bit depth is higher than 24 bits per pixel) of video data in the period (i.e. after the Guard Band) and is defined to go FALSE on the first TMDS character clock following the last active pixel of video data in the period. (NOTE: When the pixel bit depth is higher than 24 bits per pixel, a single pixel data straddles multiple TMDS character clock cycles.)

Page 53, replace the first sentence in the 8th paragraph with the following

Data Islands begin with a two-character Leading Guard Band and end with a two-character Trailing Guard Band.

Page 53, replace the last sentence in the 8th paragraph with the following

The state transition variable *packetData* is defined to go TRUE for the first TMDS character clock of the Data Island containing packet data (i.e. first TMDS character clock following the Leading Guard Band) and is defined to go FALSE following the last TMDS character clock containing packet data (i.e. the first TMDS character clock of the Trailing Guard Band).

Page 54, replace the 2nd paragraph with the following

The state transition signal AVMUTE is defined to be TRUE for a duration of one TMDS character clock coincident with

the assertion of ENC_EN or ENC_DIS if the HDCP Device is in an AVMUTE state, as defined in the HDMI Specification.

Page 55, replace the second and third sentence under State G1 with the following

Subsequently, the FrameNumber field of *inputCtr* is incremented and the DataNumber field of *inputCtr* is reset to 0(zero) at every ENC_EN; this new value for *inputCtr* must be ready within 118 TMDS character clocks after the assertion of ENC_EN. It is required that no Data Island or Video Data, nor any Guard Band, be transmitted during a keep-out period that starts 508 TMDS character clocks following VSYNC and ends 118 TMDS character clocks past the assertion of ENC_EN.

Page 59, replace 4th paragraph under Section 4.2.10 with the following

The HDCP Repeater sets *RxInfo*.HDCP2_LEGACY_DEVICE_DOWNSTREAM bit to one if an HDCP 2.0-compliant Device or HDCP 2.1-compliant Device is attached to any one of its downstream ports, else it sets *RxInfo*.HDCP2_LEGACY_DEVICE_DOWNSTREAM to zero.

Page 60, replace the row corresponding to HDCP2_0_REPEATER_DOWNSTREAM in Table 4.13 with the following

HDCP2_LEGACY_DEVICE_DOWNSTREAM	1	Rd	When set to one, indicates presence of an HDCP2.0-compliant Device or HDCP2.1-compliant Device in the topology

Page 61, replace Type decription in Table 4.16 with the following

0x00: Type 0 Content Stream. May be transmitted by the HDCP Repeater to all HDCP Devices.

0x01: Type 1 Content Stream. Except for Permitted Type 1 Audio Portion, must not be transmitted by the HDCP Repeater to HDCP 1.x-compliant Devices, HDCP 2.0-compliant Devices and HDCP 2.1-compliant Devices.

0x02 – 0xFF : Reserved for future use only. Content Streams with reserved Type values must be treated similar to Type 1 Content Streams

Page 68, Table A.1, delete rows corresponding to *V* and *V'* and insert the following rows to the table

V[255:128]	Yes	Yes	No	N/A
V'[127:0]	Yes	Yes	No	N/A
V[127:0]	No	No	No	N/A

V'[255:128]	No	No	No	N/A
M	Yes	Yes	No	N/A
M'	No	No	No	N/A

Page 72, replace "Pixel clk" in Figure D.1 with "TMDS character clk".

Add Appendix E to the specification as specified below.

Appendix E. Test Vectors

E.1 Facsimile Keys

Note: The facsimile keys provided must be used ONLY for test purposes.

All values are provided in big-endian order.

Table E.1 provides facsimile key information for transmitter T1.

	Value in Hex
Global Constant lc_{128}	93 ce 5a 56 a0 a1 f4 f7 3c 65 8a 1b d2 ae f0 f7

Table E.1

Table E.2 provides the facsimile public parameters associated with the DCP LLC key $kpub_{dcp}$. These parameters are used only for test purposes. They are not used in production devices or SRMs.

Table E.2

Table E.3 and Table E.4 provide the facsimile certificates ($cert_{rx}$) for receivers R1 and R2.

As provided in Table 2.1 of High-bandwidth Digital Content Protection System, Revision 2.2, Mapping HDCP to HDMI specification, the certificate format consists of 40-bit Receiver ID, followed by 1048-bit Receiver Public Key, 4-bit Reserved2, 12-bit Reserved1 and 3072-bit Signature fields. All values are stored in big-endian format.

For example, in Table E.3, 0x745bb8bd04 is the Receiver ID which is followed by Receiver Public Key, Reserved2, Reserved1 and Signature fields.

Table E.6

Table E.7 provides the global constant (lc_{128}) used for receivers R1 and R2. Note that the same global constant is used in T1, R1 and R2.

	Value in Hex for R1	**Value in Hex for R2**
Global Constant lc_{128}	93 ce 5a 56 a0 a1 f4 f7 3c 65 8a 1b d2 ae f0 f7	93 ce 5a 56 a0 a1 f4 f7 3c 65 8a 1b d2 ae f0 f7

Table E.7

E.2 Authentication Protocol

Table E.8 provides test vectors generated during the authentication protocol between T1-R1 and T1-R2. The values provided in the table are as generated or received on the transmitter (T1) side.

	Value in Hex for R1	**Value in Hex for R2**

Table E.9

E.3 Encryption

Table E.10 provides test vectors covering two frames of HDCP Content. Each frame has two lines with eight pixels per line. The test vectors are generated at Transmitter T1 for Receiver R2.

Note that when ENC_EN occurs, the unused key strem bits produced by the HDCP Cipher are discarded.
